ISOId=014763-2; Sequence=VSP_006490;

ITSSUE SPECIFICITY: Widely expressed in adult and fetal tissue very highly expressed in tumor cell lines such as Hela S3, K56 HL-60, SW480, A549 and G361; highly expressed in hearr, periph blood lymphocytes, liver, pancreas, spleen, thymus, prostate, ovary, uterus, placenta, testis, esophagus, stomach and through the intestinal tract, not detectable in brain.

-! INDUCTION: TNFRSF10B is regulated by the tumor suppressor p53.
-! DISEASE: Defects in TWFRSF10B may be a cause of squamous cell carcinoma of the head and neck (HNSCC) [MIM:601400].
-! SIMILARITY: Contains 3 TNFR-Cys repeats.
                                                                                                                                                                                                                                                                                                                                                                                                                                    This SWISS-PROT entry is copyright. Inter-alpha-inhibitor (I-alpha-I) is composed of H1, H and bikunin, inter-alpha-like inhibitor (I-alpha-LI) of H2 and bikunin, and pre-alpha-inhibitor (P-alpha-I) of H3 and bikunin. PTM: Heavy chains are interlinked with bikunin via a chondroiti 4-sulfate bridge to the their C-terminal aspartate (By

```
-i- FUNCTION: Involved in transport factor (Ran-GTP, karyopherin) - mediated protein import via the F-G repeat-containing domain whice acts as a docking site for substrates. Could also have isomerase or chaperone activity and may bind RNA or DNA. Component of the nuclear export pathway. Specific docking site for the nuclear export factor exportin-1.
-I- SUBUNIT; Forms a tight complex in association with RANBP1 and the ubiquitin-conjugating enzyme E2 (UBC9) (By similarity).
-I- SUBCELLULAR LOCATION: Nuclear pore complex. Cytoplasmic filaments:
-I- DOMAIN: Contains F-X-F-G repeats.
-I- SIMILARITY: Contains 8 RANBP2-type zinc fingers.
-I- SIMILARITY: Contains 8 RANBP2-type zinc fingers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     which
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            the

Despite the presence of an intact basic domain, does not bind to DNA.

-!- SUBUNIT: HETERODIMER WITH OTHER BHLH PROTEINS, LIKE TCF3 (E47).
-!- SUBCELLULAR LOCATION: Nuclear (Potential).
-!- TISSUE SPECIFICITY: Kidney, lung, brain and pancreas (insulinoma).
-!- SIMILARITY: Contains 1 basic helix-loop-helix (bHLH) domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Peyton M., Stellrecht C.M.M., Naya

DISEAS: befects in COL6A3 are a cause of Ullrich congenital muscular dystrophy (UCMD) [MIM:254090]; also known as Ullrich scleroatonic muscular dystrophy. UCMD is an autosomal recessive congenital myopathy characterized by muscle weakness and multipl joint contractures, generally noted at birth or early infancy. I clinical course is more severe than in Bethlem myopathy.

SIMILARITY: Contains 1 BPTI/Kunitz inhibitor domain.

SIMILARITY: Contains 1 fibronectin type III domain.

SIMILARITY: Contains 12 VWFA domains.

Novel high molecular weight Dermatophagoides nucleic acid polypeptides used to modify an animals' hypersensitivy to mite allergens.

Claim 3; Page 69; 154pp; English.

Sequences AAY52510-Y52522 represent proteolytic fragments of Dermatophagoides farinae high molecular weight mite allergen protein (HWM -map) composition. The HMW-map composition was isolated from a D. farinae homogenate by gel filtration, with each fraction being analysed for the presence of proteins that bound to IgE present in mite-allergic dog antisera. The HMW-map composition comprises mapA (a 109 kD protein) and mapB (98 kD). Mite allergenic proteins and peptides, and nucleic acids encoding them, may be used in therapeutic compositions to modify an animal's hypersensitivity reaction to mite allergens. Animals that may be treated include mammals and birds, especially felines, canines, equines,

                                                                                                                                          Sequences AAY52510-Y52522 represent proteolytic fragments of Dermatophagoides farinae high molecular weight mite allergen protein (HWM -map) composition. The HWW-map composition was isolated from a D. farinae homogenate by gel filtration, with each fraction being analysed for the presence of proteins that bound to IgE present in mite-allergic dog antisera. The HWW-map composition comprises mapA (a 109 kD protein) and mapB (98 kD). Mite allergenic proteins and peptides, and nucleic acids encoding them, may be used in therapeutic compositions to modify an animal's hypersensitivity reaction to mite allergens. Animals that may be treated include mammals and birds, especially felines, canines, equines, humans, other pets, and work or domestic animals. The proteins or fragments may also be used to diagnose allergies via a skin test. The proteins and peptides can also be used to raise antibodies, which have a protein of the prote
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            humans, other pets, and work or domestic animals. The proteins or fragments may also be used to diagnose allergies via a skin test. The proteins and peptides can also be used to raise antibodies, which have a variety of potential uses. For example, they can be used as vaccines to passively immunise animals against dust mite hypersensitivity, as positive controls in test kits and as tools to recover desired dust mite allergens from a mixture of proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Claim 3;

                                                  allergic response to a mite. The DNA and protein can be used in the detection of anti-Der HMW-map antibodies in animal fluids, and inhibition of immunoglobulin (Ig)E or Der HMW-map protein activity associated with a disease. Antibodies that bind to Der HMW-map are useful for inhibiting binding of proteins to IgE, to prevent immunocomplex formation, thus reducing hypersensitivity responses to mite allergens, and as vaccines against mite allergen hypersensitivity. Sequences AAU96314-AAU96342 represent Der HMW-map polypeptides of the invention
                                                                                                                                                                                                                                                                                                  Dermatophagoides, designated Der HMW-map protein, and its related nucleic acid. The Der HMW-map protein is useful for eliciting an immune response against Der HMW-map protein. The protein or a reagent comprising a non-proteinaceous epitope is useful for identifying an animal (e.g., dog, cat) susceptible to or having an allergic response to a mite. A therapeutic composition is useful for desensitising a host animal to an

                                                                                                                                                                                                                                                                                                                  Dermatophagoides, designated Der HMW-map protein, and its related nucleic acid. The Der HMW-map protein is useful for eliciting an immune response against Der HMW-map protein. The protein or a reagent comprising a non-proteinaceous epitope is useful for identifying an animal (e.g., dog, cat) susceptible to or having an allergic response to a mite. A therapeutic composition is useful for desensitising a host animal to an allergic response to a mite. The DNA and protein can be used in the detection of anti-Der HMW-map antibodies in animal fluids, and inhibition of immunoglobulin (Ig)s or Der HMW-map protein activity associated with a disease. Antibodies that bind to Der HMW-map are useful for inhibiting binding of proteins to IgE, to prevent immunocomplex formation, thus reducing hypersensitivity responses to mite allergens, and as vaccines against mite allergen hypersensitivity. Sequences AAU96314-AAU96342 represent Der HMW-map polypeptides of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Der HMW-map; American house dust mite; antiallergic; mite; IgE; mite allergenic protein; immunoglobulin E; hypersensitivity; immunocomplex formation.

                                                                                                                                       This sequence represents Dermatophagoides pteronyssius mite allergen protein (map) PDerp98-490, the mature form of pDerp98-509, PDerp98-490 has a molecular weight of 98 kD, comprising 490 amino acids, and has a high degree of homology with the D. farinae mature 98 kD allergen, maps (ANY52525). Nucleic acid molecules encoding PDerp98-490 were isolated from a D. pteronyssius cDNA library by hybridisation with a probe cenoding the D. farinae high molecular weight map (HDM-map) composition. White allergenic proteins and peptides, and nucleic acids encoding them, may be used in therapeutic compositions to modify an animal's hypersensitivity reaction to mite allergens. Animals that may be treated include mammals and birds, especially felines, canines, equines, humans, other pets, and work or domestic animals. The proteins or fragments may peptides can also be used to raise antibodies, which have a variety of potential uses. For example, they can be used as vaccines to passively intest kits and as tools to recover desired dust mite allergens from a mixture of proteins. (Updated on 06-AUG-2003 to correct OS field.)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Dermatophagoides, designated Der HMW-map protein, and its related nucleic acid. The Der HMW map protein is useful for eliciting an immune response against Der HMW map protein is useful for eliciting an immune response against Der HMW-map protein. The protein or a reagent comprising a non-proteinaceous epitope is useful for identifying an animal (e.g., dog, cat) susceptible to or having an allergic response to a mite. A therapeutic composition is useful for desensitising a host animal to an allergic response to a mite. The DNA and protein can be used in the detection of anti-Der HMW-map antibodies in animal fluids, and inhibition of immunoglobulin (Ig)E or Der HMW-map protein activity associated with a disease. Antibodies that bind to Der HMW-map are useful for inhibiting reducing hypersensitivity responses to mite allergens, and as vaccines against mite allergen hypersensitivity. Sequences ANU96314-AAU96342 represent Der HMW-map polypeptides of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Der HMM-map; American house dust mite; antiallergic; mite; IgE; mite allergenic protein; immunoglobulin E; hypersensitivity; immunocomplex formation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 14-SEP-2001; 2001WO-US028730
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Dermatophagoides farinae.

                                                                                                                                                  This sequence represents Dermatophagoides pteronyssius mite allergen CC protein (map) PDerp98-509. PDerp98-509 has a molecular weight of 98 kD, CC comprising 509 amino acids, and has a high degree of homology with the D CC farinae 98 kD allergen, maps (AAYS2523). Nucleic acid molecules encoding PDerp98-509 were isolated from a D. pteronyssius cDNA library by CC hybridisation with a probe encoding the D. farinae high molecular weight CC map (HMW-map) compositions with a literaphic proteins and peptides, and CC mucleic acids encoding them, may be used in therapeutic compositions to CC modify an animal's hypersensitivity reaction to make allergens. Animals CC that may be treated include mammals and birds, especially felines, and CC canines, equines, humans, other pets, and work or domestic animals. The proteins and peptides can also be used to raise antibodies, CC which have a variety of potential uses. For example, they can be used as CC vaccines to passively immunise animals against dust mite CC recover desired dust mite allergens from a mixture of proteins. (Updated CC on 06-AUG-2003 to correct OS field.)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Dermatophagoides, designated Der HWW-map process, and its related nucleic CC acid. The Der HWW-map protein is useful for eliciting an immune response CC against Der HWW-map protein. The protein or a reagent comprising a non-cc proteinaceous epitope is useful for identifying an animal (e.g., dog, CC cat) susceptible to or having an allergic response to a mite. A CC therapeutic composition is useful for desensitising a host animal to an CC allergic response to a mite. The DNA and protein can be used in the CC detection of anti-Der HWW-map antibodies in animal fluids, and inhibition CC of immunoglobulin (Ig)E or Der HWW-map protein activity associated with a CC disease. Antibodies that bind to Der HWW-map are useful for inhibiting CC binding of proteins to IgE, to prevent immunocomplex formation, thus reducing hypersensitivity responses to mite allergens, and as vaccines CC against mite allergen hypersensitivity. Sequences AAU96314-AAU96342 CC represent Der HWW-map polypeptides of the invention

Dermatophagoides, designated Der HMW-map protein, and its related nucleic acid. The Der HMW-map protein is useful for eliciting an immune response against Der HMW-map protein in useful for eliciting an immune response against Der HMW-map protein. The protein or a reagent comprising a non-proteinaceous epitope is useful for identifying an animal (e.g., dog, cat) susceptible to or having an allergic response to a mite. A therapeutic composition is useful for desensitising a host animal to an allergic response to a mite. The DNA and protein can be used in the detection of anti-Der HMW-map antibodies in animal fluids, and inhibition of immunoglobulin (Ig) E or Der HMW-map protein activity associated with a disease. Antibodies that bind to Der HMW-map are useful for inhibiting binding of proteins to IgB, to prevent immunocomplex formation, thus reducing hypersensitivity responses to mite allergens, and as vaccines against mite allergen hypersensitivity.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This sequence represents Dermatophagoides farinae mite allergen protein (map) pDerf98-536, the mature form of pDerf98-555 (AAX52522). pDerf98-536 has a molecular weight of 98 kD, comprising 536 amino acids, and is a component of the Dermatophagoides farinae high molecular weight mite allergen protein (HWM-map) composition. The HMW-map composition was isolated from a D. farinae homogenate by gel filtration, with each creation being analysed for the presence of proteins that bound to IgE present in mite-allergic dog antisera. White allergency proteins and compositions to modify an animal's hypersensitivity reaction to mite allergens. Animals that may be treated include mammals and birds, especially felines, canines, equines, humans, other pets, and work or composition to mother proteins via a skin test. The proteins and peptides can also be used to raise antibodies, which have a variety of potential uses. For example, they can be used as veccines to passively immunise animals as adaptose mite hypersensitivity, as positive controls in test kits and as tools to recover desired dust mite allergens from a mixture of proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                0
```

The invention relates to

an

isolated mite allergenic protein

This sequence represents Dermatophagoides farinae mite allergen protein (map) PDerf98-555. PDerf98-555 has a molecular weight of 98 kD,

The Der HMW-map protein is useful for eliciting an immune response against Der HMW-map protein. The protein or a reagent comprising a noncomprisition is useful for identifying an animal (e.g., dog, cat) susceptible to or having an allergic response to a mite. A compression of the rapeutic composition is useful for desensitising a host animal to an callergic response to a mite. The DNA and protein can be used in the detection of anti-Der HMW-map antibodies in animal fluids, and inhibition of immunoglobulin (Ig)E or Der HMW-map protein activity associated with a compression of proteins to IgE, to prevent immunocomplex formation, thus reducing hypersensitivity responses to mite allergens, and as vaccines against mite allergen hypersensitivity. Sequences ANU96314-AAU96342 represent Der HMW-map polypeptides of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                         17-APR-1998;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            comprising 555 amino acids, and is a component of the Dermatophagoides of farinae high molecular weight mite allergen protein (HWM-map) composition. The HWM-map composition was isolated from a D. farinae composition was isolated from a D. farinae for composition. The HWM-map composition was isolated from a D. farinae composition was isolated from a D. farinae for the present of proteins that bound to IgE present in mite-allergic dog antisera. Mite allergent proteins and peptides, and nucleic acids encoding them, may be used in therapeutic compositions to modify an CC animal's hypersensitivity reaction to mite allergens. Animals that may be treated include mammals and birds, especially felines, canines, equines, thmans, other pets, and work or domestic animals. The proteins or fragments may also be used to diagnose allergies via a skin test. The proteins and peptides can also be used to raise antibodies, which have a corriety of potential uses. For example, they can be used as vaccines to passively immunise animals against dust mite hypersensitivity, as constructed an intest kits and as tools to recover desired dust mite to the controls in test kits and as tools to recover desired dust mite to the controls of proteins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Query Match

The invention relates to an isolated mite allergenic protein of Dermatophagoides, designated Der HWW-map protein, and its related nucleic acid. The Der HWW-map protein is useful for eliciting an immune response against Der HWW-map protein. The protein or a reagent comprising a non-proteinaceous epitope is useful for identifying an animal (e.g., dog, cat) susceptible to or having an allergic response to a mite. A therapeutic composition is useful for desensitising a host animal to an allergic response to a mite. The DNA and protein can be used in the detection of anti-Der HWW-map antibodies in animal fluids, and inhibition

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ននិននិង
                      The invention relates to an isolated mite allergenic protein of CC Dermatophagoides, designated Der HMW-map protein, and its related nucleic acid. The Der HMW-map protein is useful for eliciting an immune response against Der HMW-map protein. The protein or a reagent comprising a non-CC proteinaceous epitope is useful for identifying an animal (e.g., dog, CC cat) susceptible to or having an allergic response to a mite. An CC therapeutic composition is useful for desensitising a host animal to an CC dilergic response to a mite. The DNA and protein can be used in the CC detection of anti-Der HMW-map antibodies in animal fluids, and inhibition CC disease. Antibodies that bind to Der HMW-map grotein activity associated with a CC disease. Antibodies that bind to Der HMW-map are useful for inhibiting CC binding of proteins to IgE, to prevent immunocomplex formation, thus creducing hypersensitivity responses to mite allergens, and as vaccines CC against mite allergen hypersensitivity.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           of immunoglobulin (Ig)E or Der HMW-map protein activity associated with disease. Antibodies that bind to Der HMW-map are useful for inhibiting binding of proteins to IgE, to prevent immunocomplex formation, thus reducing hypersensitivity responses to mite allergens, and as vaccines against mite allergen hypersensitivity. Sequences AAU96314-AAU96342 represent Der HMW-map polypeptides of the invention
                                                                                                                                                                                                                                                                                                                                            New mite allergenic protein isolated from Dermatophagoides, designa Der HMW-map protein, useful as a vaccine for treating mite allergy.
                                                                                                                                                                                                                                                                                                                                                                                               WPI; 2002-351888/38.

                                                                                                                                           The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABI30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins (ABB57737-ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
